Permissions summary for Cloud Manager

In order to use the features and services in Cloud Manager, you'll need to provide permissions so that Cloud Manager can perform operations in your cloud environment. Use the links on this page to quickly access the permissions that you need based on your goal.

AWS permissions

Purpose	Description	Link
Connector deployment	The user who creates a Connector from Cloud Manager needs specific permissions to deploy the instance in AWS.	Create a Connector in AWS from Cloud Manager
Connector operation	When Cloud Manager launches the Connector, it attaches a policy to the instance that provides the permissions required to manage resources and processes in your AWS account. You need to set up the policy yourself if you launch a Connector from the marketplace or if you add more AWS credentials to a Connector. You also need to ensure that the policy is up to date as new permissions are added in subsequent releases.	AWS permissions for the Connector
Cloud Volumes ONTAP operation	An IAM role must be attached to each Cloud Volumes ONTAP node in AWS. The same is true for the HA mediator. The default option is to let Cloud Manager create the IAM roles for you, but you can use your own.	Learn how to set up the IAM roles yourself

Azure permissions

Purpose	Description	Link
Connector deployment	When you deploy a Connector from Cloud Manager, you need to use an Azure account or service principal that has permissions to deploy the Connector VM in Azure.	Create a Connector in Azure from Cloud Manager

Purpose	Description	Link
Connector operation	When Cloud Manager deploys the Connector VM in Azure, it creates a custom role that provides the permissions required to manage resources and processes within that Azure subscription. You need to set up the custom role yourself if you launch a Connector from the marketplace or if you add more Azure credentials to a Connector. You also need to ensure that the policy is up to date as new permissions are added in subsequent releases.	Azure permissions for the Connector

Google Cloud permissions

Purpose	Description	Link
Connector deployment	The Google Cloud user who deploys a Connector from Cloud Manager needs specific permissions to deploy the Connector in Google Cloud.	Set up permissions to deploy the Connector
Connector operation	The service account for the Connector VM instance must have specific permissions for day-to-day operations. You need to associate the service account with the Connector when you deploy it from Cloud Manager. You also need to ensure that the policy is up to date as new permissions are added in subsequent releases.	Set up a service account for the Connector

AWS permissions for the Connector

When Cloud Manager launches the Connector instance in AWS, it attaches a policy to the instance that provides the Connector with permissions to manage resources and processes within that AWS account. The Connector uses the permissions to make API calls to several AWS services, including EC2, S3, CloudFormation, IAM, the Key Management Service (KMS), and more.

IAM policy

The IAM policy shown below provides the permissions that a Connector needs to manage resources and processes within your public cloud environment based on your AWS region.

When you create a Connector directly from Cloud Manager, Cloud Manager automatically applies this policy to the Connector.

If you deploy the Connector from the AWS Marketplace or if you manually install the Connector on a Linux host, then you'll need to set up the policy yourself.

You also need to ensure that the policy is up to date as new permissions are added in subsequent releases.

When Cloud Manager launches the Connector VM in Azure, it attaches a custom role to the VM that provides the Connector with permissions to manage resources and processes within that Azure subscription. The Connector uses the permissions to make API calls to several Azure services.

== Custom role permissions

The custom role shown below provides the permissions that a Connector needs to manage resources and processes within your Azure network.

When you create a Connector directly from Cloud Manager, Cloud Manager automatically applies this custom role to the Connector.

If you deploy the Connector from the Azure Marketplace or if you manually install the Connector on a Linux host, then you'll need to set up the custom role yourself.

You also need to ensure that the role is up to date as new permissions are added in subsequent releases.

Cloud Manager requires permissions to perform actions in Google Cloud. These permissions are included in a custom role provided by NetApp. You might want to understand what Cloud Manager does with these permissions.

== Service account permissions

The custom role shown below provides the permissions that a Connector needs to manage resources and processes within your Google Cloud network.

You'll need to apply this custom role to a service account that gets attached to the Connector VM. View step-by-step instructions.

You also need to ensure that the role is up to date as new permissions are added in subsequent releases.
